Trainee DevOps Engineer test task

Result

As confirmation of the completed task, the candidate should send the following:

1. Link to your image on hub.docker.com
2. Link to your GitHub repository with the completed task

Steps

1. Fork original GitHub repository
2. Write Dockerfile that builds and runs forked C++ application
3. Write Bash script that clones the repository, builds the docker image and sends built image to Docker hub.
4. **(Optional)** Override default output in console "Hello World" to have "Hi there" in output (few options here how to override this - change settings.conf / pass as arguments from command line / use environment variables - check different options, pros/cons and select the best one).
5. Add, commit and push your Bash script and Dockerfile to your forked repository.

Toolset

- Bash
- Docker
- Docker Hub
- The sources of the app
